

VERACITYCAST™

FORECASTING COMPLEX COST AND RESOURCE CHALLENGES

Uniquely Optimizing the Flow of Critical Assets

ASSET MANAGEMENT AND PLANNING SYSTEM (AMPS)

A modern web-based inventory management and demand planning tool for managing mission-mounted equipment (MME) such as ALQ-99 and ALQ-249.

AMPS is a comprehensive system for inventory tracking, data analytics, and readiness reporting, providing authoritative MME data for use by the fleet and PMA-234. AMPS is the data backbone for IDSP prescriptive forecasts.

AMPS is hosted in NAVAIR's eDMZ infrastructure and on the CANES networks for afloat use.

INTEGRATED DECISION SUPPORT PROCESS

Integrated Decision Support Process (IDSP) combines ops research, an authoritative baseline, and advanced analytics in a unique process for managing future cost and resource allocations.

The process iterates copious amounts of historical data with planning, budget, and policy info for authoritative forecasting.

IDSP uniquely provides excursions from baseline forecasts to address "What if?" questions for unprecedented insight.

PRESCRIPTIVE ANALYTICS

VeracityCast and IDSP explicitly link near-term HQ budget and Program Office funding decisions to their readiness outcomes.

This powerful computational engine helps inform near-term (1-5 year) through long-term (30-40 years) enterprise outcomes, based in prescriptive analytics for strategic decision making.

UNIQUE, PRESCRIPTIVE LIFE-CYCLE MANAGEMENT

VeracityCast synchronizes supply with demand: how, when, and where an asset (supply) should be maintained or modified with the operational schedule (demand). All assets' supplies and demands are considered "from cradle to grave."

ADVANCED CAPABILITIES CREATE EXCEPTIONAL RESULTS

The VeracityCast computational engine is **platform-independent**. It runs on any OS that implements Python and Rust runtimes (virtually all Operating Systems).

Flexible, standard architecture allows **customization** for each client's unique requirements.

VeracityCast implements an **advanced plugin-based architecture** that allows custom code injection in a standard discrete time-stepped simulation control loop.

The forecast **captures enterprise behavior** with minimal front-end investment.

AMPS ENABLES THE FOLLOWING FUNCTIONS, AMONGST OTHERS:

- Asset managers have full visibility into the custody, status, and condition of every asset in the inventory at all times.
- Operators can report on the status and condition of every asset in their custody from anywhere in the world.
- Asset managers can access information such as serial numbers, part numbers, production lot numbers, embedded software versions, etc. for all assets in the inventory.
- Asset managers can plan, direct, and track induction of assets for Engineering Change Proposals (ECP) and other modifications.
- Maintenance personnel can track the maintenance and materiel condition of assets under repair.

IDSP AND VERACITYCAST CLARIFY AND FORECAST COMPLEX COST AND RESOURCE CHALLENGES

Inventory Management: optimizing the flow of critical assets, e.g., aircraft, ships, radars, pods, manpower.

Service Life Modification Planning: balancing near-term readiness and long-term force structure to optimize aircraft availability.

Stakeholder Alignment: quantitatively integrating plans from all echelons with authoritative baselines.

Convergence of Modifications Planning: synchronizing complex streams of discrete mod requirements and optimizing force capability.

◆ Decision Advantage for National Security

Systems Planning & Analysis (SPA) is a global, independent analytical and technical innovation firm advancing complex national security priorities. SPA delivers mission engineering, advanced analytics, operational insights, and technology-enabled solutions that accelerate capability delivery and inform strategic decision-making across defense, intelligence, homeland security, and other critical mission areas.
